EPMWARE

Master Data Management and Data Governance

EPMware software is designed for the business user to regain control of their metadata. Design and enforce data governance practices using highly configurable workflows tied into a robust approval process. Sharing hierarchies across enterprise domain cloud and on-premises applications with EPM, ERP, Customer, Product and Supplier applications now becomes a seamless process, creating dimensional consistency across all subscribing systems.

Designed for the Business User

EPMware is designed to allow the business user to easily view and create metadata requests and submit the request for review and approval through a workflow process. This saves organizations the time and expense of updating multiple applications with the same metadata and streamlines the otherwise manual and uncoordinated process of requesting metadata changes traditionally managed in Excel or Share Point. EPMware enables business users to contribute to the process of managing metadata, improving accuracy and consistency otherwise left to technical teams to guess at.

Plug and Play Adapters for all Hyperion Cloud and On-Prem

Out of the box plug and play adapters allow for rapid implementation and configuration to supported applications. This includes EPMA, Classic HFM, Planning, Essbase, and all Oracle Cloud EPM applications such as FCCS, PBCS and OAC. Designed by Hyperion consultants with decades of implementation experience, EPMware strives to bring effortless metadata management back to the business.

Automated Dimension and Property Management

EPMware Logic Builder™ enables automated dimension and property sharing across all applications to simplify metadata management. The application can be configured so updates are derived or defined with custom or default values in one request for multiple applications. Built in and custom validations ensure user compliance with enterprise metadata standards.

Deploy Directly to Applications

EPMware's deployment module allows a custom or adapter based direct metadata push to any subscribing application in a configurable format.

BENEFITS

- Manage all application metadata in a central repository
- Multi-Domain MDM – Financial, Customer, Product, and Supplier data
- Workflow and Data Governance for SOX compliance
- Plug and Play adapters for rapid deployment
- Easy to implement
- Enterprise licensing, <u>NOT</u> per node licensing
- Pre-configured audit reports
- Pre-built integration to Oracle EPM Cloud and On-premise applications

FEATURES

- Cloud SaaS offering or On-Premise
- ERP Import and Bulk Upload
- Share metadata with On-Premise Hyperion and all Oracle Cloud applications
- Configurable workflows for change management
- Prebuilt adaptors to import Hyperion and Oracle EPM Cloud metadata
- Complete security model integrates with LDAP, MSAD, and SAML 2.0 (SSO)
- Scheduled automated metadata deployments to target applications
- Seamless metadata integration
- Full featured dashboard to manage requests
